

Abstract

A specimen package includes a top, a first side, connected to the top, a bottom, connected to the first side, and a second side, connected to the bottom. The package also includes therein an internal separator. The internal separator forms a first compartment
5 and a second compartment within the package. The top includes a window for viewing the first compartment. The bottom includes a second window for viewing the second compartment. The top, the first side, the bottom, the second side, and the internal separator can all be formed by folding a shaped planar sheet. The first compartment can contain a specimen, placeable within the first compartment. The second compartment
10 can contain a label, placeable within the second compartment. The specimen is viewable through the first window, and the label is viewable through the second window.
